

Table 1: Experiment B protocol: source-building scarcity.

Section	Setting	Value
Design	Scarcity variable	Distinct source buildings, K
	Budget levels	K=50, 100, 200, 400, 725
	Context construction	Strictly nested building prefixes within each seed
	Building seeds	0–4; K=725 has none
	Row seeds	0 and 1; K=725 uses 0–4
	Random generator	NumPy PCG64
	Building sampling	One permutation per seed, then strict K prefixes
	Selection constraint	None
	Labeled rows	50,000 at every K
	Class ratio	Anomaly:normal = 1:1; 25,000 each, without replacement
Reproducibility	Uncertainty	Row seeds averaged within building seed; mean and standard error across building seeds
Data and models	Features	137 engineered features
	Models	Tree Ensemble; TabPFN (8 estimators)
	Modeling seed	42
Evaluation	Holdout	Odd-ID buildings; 4,102,084 rows
	Metric	PR-AUC by meter; chilled water, steam, hot water
